
Moscow substation energy storage

Are underground substations being built in Skolkovo Innovations Centre near Moscow?

Two underground substations are being built in the Skolkovo Innovations Centre near Moscow. The Innovations Centre is often advertised as the 'Russian Silicon Valley'. Construction of the Innovations Centre relied on substantial exemptions in terms of land management and urban planning law and regulations.

What happened to the Belorussky substation in Moscow?

The substation in Moscow was planned for the Belorussky railway station area. This area underwent and still is undergoing major reconstruction and is among the most expensive business and residential districts in Europe.

Why do megalopolises need underground electrical substations?

Land in growing megalopolises is becoming increasingly expensive. An underground electrical substation allows the use of the surface for other valuable urban uses. Harsh weather and dangers of possible terrorism may also make attractive an underground location for important electricity infrastructure.

Where are electrical substations located?

Although electrical substations have been located underground in Japan and the United Kingdom since the late 1960s, the practice is still rare. The first underground substation in the United States was opened in California as recently as 2006. Such rare and complex technology requires engineering and land planning specific to each new project.
