How can farmers benefit from solar energy?

Farmers can benefit from solar energy in several ways--by leasing farmland for solar; installing a solar system on a house, barn, or other building; or through agrivoltaics. Agrivoltaics is defined as agriculture, such as crop production, livestock grazing, and pollinator habitat, located underneath solar panels and/or between rows of solar panels.

What are solar panels & how do they work?

These panels generate electricity while simultaneously allowing crops to grow underneath. The solar panels provide partial shade to the crops, which can improve resilience to extreme weather, reduce water needs, and boost crop yields in some cases. PV Modules aren't just energy generators--they're microclimate managers.

How do agrivoltaic solar panels work?

(Let's Get Technical!) In agrivoltaics, solar panels are typically mounted on structures above crops or grazing areas. These panels generate electricity while simultaneously allowing crops to grow underneath.

Why are farmers planting crops under solar panels?

One analysis of the unexpected reason farmers are planting crops under solar panels notes that many crops grown in these systems, including vegetables and specialty fruits, benefit from the moderated temperatures and lower evapotranspiration beneath the arrays.

Choices made early on, like the inter-panel and inter-row spacing between solar panels, will impact the kind of farming that can be supported. In conclusion, the long-term ...
