# Solar panels rotate to generate electricity

How do solar panels generate electricity?

This is where electricity generated by the panel flows into an electrical system of a home or a power grid. Now that you understand how solar panels are constructed, let's dive into how they generate electricity. There are two primary ways in which solar panels generate electricity: thermal conversion and photovoltaic effect.

How does solar energy work?

The amount of sunlight that strikes the earth's surface in an hour and a half is enough to handle the entire world's energy consumption for a full year. Solar technologies convert sunlight into electrical energy either through photovoltaic (PV) panels or through mirrors that concentrate solar radiation.

How do solar inverters work?

Solar inverters transfer the converted AC energy to your home's electrical panel. From there, electricity is dispersed through your house to all of your outlets so that when your devices are plugged in, a usable electric current is available. If you have a grid-tied solar energy system, electricity can run both to and from the power grid.

How do solar panels convert sunlight into electricity?

At the heart of solar panels are photovoltaic (PV) cells, which are responsible for converting sunlight into electricity. Here's a simplified breakdown of the process: 1. Absorption of Sunlight: - Solar panels are made up of many PV cells, typically composed of silicon.
